HIGH PERFORMANCE TAPS, DIES, CENTER DRILLS AND GAGES

Mr. Jokichi Watanabe, founder of Yamawa Manufacturing, located his company in Shibuya-Ku, Tokyo during 1923. Since then, Yamawa continues a strong effort to evolve its manufacturing technology along with the progress of machine tool development worldwide. As a group, Yamawa responds to the customers needs by continuously focusing on research and development of products, processes and quality improvements.

The definition of YAMWA is "greater prosperity, more united". In these words, Jokichi Watanabe had a vision, as the company becomes prosperous, the harmony among its employees become more precious. From its inauguration in 1923, the Yamawa Group has continued to invest in the development and manufacturing of the highest quality cutting tools to meet the demanding needs of the worldwide technology industries.

The many users of Yamawa high quality taps and cutting tools include aerospace, defense, telecommunications, automotive, oil tool, wind generation, ship building, machine tools, electronic appliances, IT industries and others. Year after year, Yamawa branded products continue to receive the highest recognition for consistent reliance from the worldwide market.

Yamawa continues the investigation of excellence in development and manufacturing by seeking the best technology available in today's market. When there are no major improvements available in machine tool technology, Yamawa continues to manufacture its own precise machinery to manufacture the highest quality cutting tools available in the worldwide market. It is with great pride that Yamawa was the first manufacturer in Japan to obtain ISO9001 not only through technology but quality control.

Yoshi Watanabe, current President of Yamawa states "The Yamawa spirit contributes to industries by producing the most Reliable Screw Threads. These reliable threads are indispensable as the basis of manufacturing. Yamawa realizes that a consistent supply of high quality and high performance products satisfies our customers requirements and contributes to the technological evolution of industrial fields and advancement of society.

Realizing that enterprise gives influence to earthy environment, Yamawa contributes to our society by manufacturing the highest quality cutting tools, and proceeds with the continuous development of activities while protecting environment. All employees participate in the activities of protecting our mutual environment.

We thank you for your continued support.

Creating high quality, high performance taps, cutting tools and to support technical innovation in metal machining.

As rapid technical innovation unfolds in every field of industry, metal cutting and threading are faced with demands for higher quality and more efficient machining.

By developing and supplying more precise, high performance taps and center drills to meet these evolving needs, YAMAWA is contributing to the advancement of global machining.

Product Line Precision

Cutting Tools

- Taps • Center Drills • Gages • Dies

Regrind Fixtures

- Tap and Drill Sharpeners

Precision Pitch Diameter Measuring Machines

- Three-wire measuring machine for highly accurate pitch diameter measurement

YAMAWA products respond to a wide variety of technical demands, addressing a wide range of metal processing needs, including:

Tapping hard to machine materials

Technological advances in the aerospace industry and other fields have prompted the use of various new light weight, heat resistant materials such as titanium and nickel based alloys. The extreme hardness and toughness of these materials accelerate wear on cutting tools, making conventional taps inadequate. YAMAWA continues to develop specific high performance tap designs for such hard to machine materials. We supply a broad range of new products in response to evolving customer needs, supporting the cutting edge of the next generation of metal processing.

New tap innovation

Yamawa has introduced new taps for high-performance threading of high-silicon aluminum and wrought aluminums.

YAMAWA is continuously updating tap designs based on meeting and exceeding our customers' tapping needs for increased quality at higher production rates.

Industry demand for high production and higher quality screw threads.

High-speed, high-precision, multi-function CNC machine tools in the field of metal machining, have provided the platforms for threading improvements. YAMAWA has been quick to respond to this emerging trend, leading the industry in the development and introduction of taps for CNC and high-speed and ultra high-speed machining. We continue to produce a steady stream of high-performance taps in response to today's increasingly high demand for quality threads at reduced tapping costs.

Environmental protection and increased efficiency

YAMAWA is actively engaged in finding solutions for the increasing important problems of coolant management. Our proprietary oil-less thread forming taps have eliminated the need for cutting oil during tapping for popular thread sizes. This not only enables cleaner threading but also makes the entire process more efficient by eliminating chips during threading and reducing the cleanup step.

W
A

Our technical expertise continues to create high quality, high performance products while protecting the environment.

For more than 89 years, YAMAWA has continued to develop superior technical expertise as a pioneer in the tap and die industry.

The Yamawa employees technological know-how throughout has helped to produce many of the diverse products that have supported our growth over the years. We have established a flexible production system and a research and development system geared to the needs of our customers.

We remain committed to the development of high-quality, high-performance products, while continuing to refine and advance our technical capabilities.

YAMAWA's Unique Capabilities

Tap production involves the grinding of many features on a tap blank to produce a finished precision tool. For many years, YAMAWA has recognized the need to build these precision tap grinding machines "in house" as a means of achieving greater tool precision and higher quality tools. Today, YAMAWA makes more than 90% of its own production machines, thereby controlling tap quality from cutoff to final laser marking and measurement. Machines manufactured include machine tools to thread, flute grind, chamfer, tap square, OD grind, and machines to measure all of the taps' critical elements such as thread pitch diameter. The self-reliance at YAMAWA allows us to control product quality and production capabilities by custom engineering machines not readily available in the open market. At YAMAWA, we understand how to make taps, tap manufacturing machines and tap measuring equipment.

Research and Development

To achieve maximum tapping efficiency, we analyze materials to be tapped in detail. After carefully selecting a tap base material we thoroughly control heat treatment and design. This allows us to develop and supply taps that are ideally suited to their application.

In addition to the basic tap research taking place at our technical research center, we also have a test center where we conduct performance and durability tests on the taps produced at Yamawa to evaluate tool performance with the goal of continuous improvement.

Quality Control

Equipped with many measuring machines manufactured in-house, YAMAWA maintains a rigorous quality system that includes inspection of both the machine stage and for finished goods. This quality control system has received widespread acclaim, along with numerous awards. In 1996, the Yonezawa Plant stepped ahead of our competitors by receiving ISO 9001. The Fukushima Plant and Aizu Plant were ISO 9001 certified in 2000 facilities. The Tsutsumi plant and the head quarters were certified with ISO9001 in 2012..

ISO 14001

Yamawa is proud to announce the certification of ISO14001 for all manufacturing facilities and operations. Our aim is to preserve the environment for future generation under the themes as an ecological friend while producing the best screw threads available today. Yamawa recognizes that enterprise activities have a major influence on the earth's environments and as a large corporation we proceed with the protection and continuous improvement of the environment. Yamawa decreases the burden on environment, and respects the environmental rules as it continues to pursue an environment friend enterprise.

Yonezawa Plant (ISO 9001: 2000)

Yonezawa is the main manufacturing plant of the Yamawa Group, this location is equipped with production lines and is the Quality Control Center. The plant obtained ISO 9001 certification in 1996. Of the four Yamawa plants, the Yonezawa location has the longest history of manufacturing and the highest production capacity. Products include roll taps, spiral point, pipe and hand taps.

The Yonezawa Plant stepped ahead of our competitors by receiving ISO 9001 before any other cutting tool manufacturing in Japan.

Fukushima Plant (ISO 9001: 2000)

The Fukushima plant provides both tap production lines and in house facilities for the manufacturing of specialized production machine tools to produce the exceptional high quality cutting tools. This plant develops and manufactures special tap and die production equipment. It also supplies these machines to our other manufacturing sites. Products include spiral flute taps, dies and combined drills/countersinks as well as production machinery.

Aizu Plant (ISO 9001: 2000)

Equipped with the most sophisticated machine tools available, this plant is famous for its automation and robotized labor saving manufacturing processes. The plant is designed for mass production of the highest quality cutting tools and screw thread tools. Products include spiral fluted taps and carbide taps.

Tsutsumi plant (ISO 9001;2000)

The Tsutsumi plant is the main tool blank manufacturing operation of Yamawa group. This location is also the testing center where Yamawa executes the innovation in metal machining and performance tests of the products for the Yamawa group.

A

- November 1923 Founded by Jokichi Watanabe in Shibuya-ku, Tokyo.
- December 1937 Company Incorporated.
- May 1945 Factory established in Yonezawa City in Yamagata prefecture.
- January 1953 Spun off Yonezawa Factory into a separate company as Yamawa Tap Co. LTD.
- June 1955 All products certified to Japanese Industrial Standards (JIS) categories.
- October 1956 Award by the Department of Trade and Industry for superiority in industrial standardization.
- April 1964 Newly constructed Fukushima Factory began operation.
- November 1973 Award by the Department of Trade and Industry for superiority in industrial standardization.
- October 1983 Established YAMAWA ENGINEERING Co., LTD.
- December 1984 New machine tool manufacturing facility constructed inside the Fukushima Factory.
- October 1986 Newly completed Aizu Factory opened.
- April 1991 Spun off Fukushima Factory and Aizu Factory into a separate company, YAMAWA PRECISION Co., LTD.
- November 1995 Established TC (Total Cutting) CENTER Co., LTD.
- June 1996 [YAMAWA TAP Co., LTD. obtained ISO 9001 certification.](#)

Explanation of icons

I C O N S

	High Speed Steel + 3% Vanadium		Oxide and nitride surface toughening treatment		For left-hand screw threads
	Cobalt High Speed Steels		Titanium Nitride coating		For synchronized tapping
	Powder High Speed Steels		Titanium Carbon Nitride coating		Number of pitches for chamfer part
	Ultra micro grain tungsten carbide		Titanium Nitride Aluminum coating		For through hole
	Cemented carbide		With oil hole for blind hole tapping		For horizontal blind hole
	Alloy tool steels		With oil hole for through hole tapping		For vertical blind hole
	Oxide surface treatment		Helix angle of spiral flute		For blind hole
	Nitride surface toughening treatment		Helix angle of left-hand spiral flute		

How to Order YMW Standard Taps

Ordering Instructions: Use EDP numbers when ordering to save time and avoid errors.

Packaging:

To insure your YMW taps arrive in good condition, we request purchases be made in full package quantities only. Standard Package Quantities:

Package Quantity	Product Size Ranges				Center Drills	Dies
	Unified Screw Threads No. 0-12 1/2" - 7/8"	Pipe 1/16" - 3/4"	Metric M1 - M24 M25 & over			
3 pieces per pkg.					00-8	—
1 piece per pkg.	1" & over and all extended taps	1" & over	M25 & over		—	13/16" O.D. to 2" O.D.

BASED ON 65-75% THREADS, 1-2X DIAMETER, THROUGH HOLE

ZELX SS Spiral Fluted Taps are designed for difficult jobs including the stainless steel family of materials as well as alloy steels, high carbon steel and ductile irons. Our unique design ZELX SS taps increase productivity through longer tool life. The unique spiral point chamfer makes them ideally suited for difficult to machine materials. All SS taps are designed with ANSI dimensions.

High Speed Steel +3% Vanadium Taps

For Stainless Steels, Alloy Steels and Ductile Irons.

ZELX SS taps are suitable for UNJ Aerospace internal threading applications

Spiral Fluted Taps for Stainless Steels

For Unified threads

ZELX SS

ZELX SS Spiral Fluted Taps are designed for difficult jobs including the stainless steel family of materials as well as alloy steels, high carbon steel and ductile irons. Our unique design ZELX SS taps increase productivity through longer tool life. The modified bottom chamfer makes them ideally suited to blind hole tapping.

ZELX Spiral Fluted Taps are oxide surface treated or Titanium Nitride (TiN) coated to reduce loading and galling of product material, improving tap wearlife and thread quality.

Necked design enhances flow of cutting fluid to cutting teeth and reduces surface contact between the tool and work-piece for more efficient threading.

All SS taps are designed with ANSI dimensions.

The special ZELX tool geometry creates less torque, better removal of chips and runs cooler.

High Speed Steel +3% Vanadium Taps

ZELX SS taps are suitable for UNJ Aerospace internal threading applications.

*The nominal size of a Pipe Tap is that of the pipe fitting to be tapped, not the actual size of the tap. The thread tapers 3/4 of an inch per foot.

ZELX SS Spiral Fluted Pipe Taps are designed for difficult jobs including the stainless steel family of materials as well as alloy steels, high carbon steel and ductile irons. Our unique design ZELX SS Pipe taps increase productivity through longer tool life.

ZELX Spiral Fluted Pipe Taps are oxide surface treated or Titanium Nitride (TiN) coated to reduce loading and galling of product material, improving tap wearlife and thread quality.

Taper Pipe Tap Standard Projection

ZELX Pipe Taps are designed for difficult jobs including stainless steels, alloy steels and ductile irons.

†Taper Pipe tap standard projection is the distance the small end of the tap projects through an American National Standard Pipe Thread Ring Gage.

MOLD HAND TAPS

Ideal for tapping mold steels, tool steels and gray cast irons, YMW offers this series of ZELX Mold Taps made of Cobalt High Speed Steel, ZELX Mold Hand Taps and Mold Pipe Taps.

Combined with specially designed geometry, Cobalt High Speed Steel improves the toughness of ZELX Taps for use in Prehardened Mold Steels. Furnished bright without surface treatment, taps can be surface treated upon request.

Ideal for tapping mold steels, tool steels and gray cast irons. (35 to 45 HRC)

YMW offers this series of ZELX Mold Taps made of Cobalt High Speed Steel.

3/4	14	5	389646	1-3/8	3-1/4

Titanium Nitride coating (TiN) is available upon request.

TiN coating approaches the hardness of carbide.

TiN's smooth, hard finish increases tool life and helps to improve product thread flank finish.

Carbide Taps for Non-Ferrous Materials

For Unified threads

YMW solid ultra fine grain carbide taps are manufactured from the finest micro grain carbide for exceptional wear life and reduced chipping.

For the longest tool life available from any tap, YMW offers two carbide tap designs — one for tapping cast irons and another for aluminums.

Ideal for long production runs where reduced tool changes mean improved production efficiency. Thin film coatings such as TiN (Titanium Nitride) and TiCN (Titanium Carbonitride) are available upon request.

YMW carbide taps have also proven to be an excellent choice for threading very abrasive materials below 40Rc, such as alloy steels, stainless steels, exotic alloys and non metallics.

Spiral Fluted Taps for Nickel Base Alloys

For Unified threads

ZELX NI

Available in bright; add "B" to EDP No. ZELX NI taps are suitable for UNJ Aerospace internal threading applications

Modified Bottoming Style

(3 to 4 threads chamfered)

Taps have an oxide and nitride surface toughening treatment.

ZELX NI Taps have been designed for extended tap life in Cobalt, Nickel and Iron base exotic materials such as: Inconel, Hastelloy, Waspalloy and harder Stainless Steels, Mold and Tool Steels >30Rc.

ZELX NI

Spiral Fluted Metric Taps for Nickel Base Alloys

For Metric threads

**ZELX NI METRIC**

ZELX NI Taps have been designed for extended for extended tap life in Cobalt, Nickel and Iron base exotic materials such as: Inconel, Hastelloy, Waspalloy and very hard Stainless Steels, Mold and Tool Steels >30Rc. All SS metric taps are designed with ANSI shank dimensions.

Modified Bottoming Style

(3 to 4 threads chamfered)

For Nickel Alloys, Inconel & Stainless Steels > 30Rc

Taps have an oxide and nitride surface toughening treatment

Spiral Fluted Taps for Titanium Alloys, Magnesium and Beryllium Copper

Cobalt, Vanadium Premium Steel Taps

For Titanium, Titanium Alloys, Magnesium and Beryllium Copper
ZELX TI taps are suitable for UNJ Aerospace internal threading applications.

For Unified threads

ZELX TI

ZELX TI Slow Spiral Flute Taps have a left hand spiral flute design specifically designed to tap R.H. Threads in Titanium and Titanium Alloys. The Left Hand Slow Spiral makes this series of taps ideal for through hole tapping of right hand threads. The ZELX TI Taps are made from a cobalt, high vanadium base tool material to provide increased productivity as well as increased tap life while tapping Titanium.

Plug Style

(4.5 to 6 threads chamfered)

Taps have a nitride surface toughening treatment

Industrial Quality Hand Taps for Cast Irons

For Unified and Metric threads

IQ HT-CI

These taps have a geometry suited for tapping gray irons and irons that produce broken chips. This design is also appropriate for some non-metallics such as Bakelite and Cast Brass.

Vanadium High Speed Steel Taps
Ideal for steels, irons, brass and plastics in through hole applications.

These taps are designed to tap steels and ferrous materials that produce stringy chips. They are also ideal for brass, plastics in through hole applications.

Spiral Pointed taps are recommended for tapping through holes or blind bottoming holes where the hole depth is great enough to allow for chip accumulation at bottom of the hole.

ZELX IQ taps are suitable for UNJ Aerospace internal threading applications.
All SS taps are designed with ANSI shank dimensions.

Industrial Quality Spiral Pointed Metric Taps

For Unified and Metric threads

IQ

YMW Spiral Pointed Taps are engineered to shear product material efficiency during the threading operation. Spiral pointed taps shoot chips out ahead of the tap during threading, reducing loading and clogging of the flutes with product chips.

YMW Metric Taps

Metric taps are available in the most popular "D" Limits for ISO 6H Tolerance Class threading. Metric taps are manufactured to ANSI inch blank dimensions.

These taps are designed to tap steels and ferrous materials that produce stringy chips. They are also ideal for brass, plastics in through hole applications.

Spiral Pointed taps are recommended for tapping through holes or blind bottoming holes where the hole depth is great enough to allow for chip accumulation at bottom of the hole. Taps have oxide surface treatment

YMW Spiral Pointed Taps are engineered to shear product material efficiency during the threading operation. Spiral pointed taps shoot chips out ahead of the tap during threading, reducing loading and clogging of the flutes with product chips.

ZELX IQ taps are suitable for UNJ Aerospace internal threading applications

I Q P O B O T T O M

Industrial Quality Spiral Fluted Taps

For Unified threads

IQ SPYMW-USA
1/4"-20 GH3

YMW Spiral Fluted Taps are engineered for improved chip lifting action in threading blind bottoming holes. The spiral flute design helps lift the chips up and out of the product hole during threading, improving threading efficiency. The approximate 45° spiral flutes also permit the spanning of keyways or cross drilled holes during threading.

These taps are ideal for blind hole tapping ferrous materials that produce stringy chips. For more difficult alloy steel and exotic alloy tapping, see ZELX® taps for application recommendations on page 10.

Vanadium High Speed Steel Taps
Ideal for blind hole tapping ferrous materials that produce stringy chips.

The secret to threading deep blind holes is the handling and disposal of the chips generated during the threading process. Spiral fluted taps lift chips up and out of the product hole during threading. Handling product chips in this way reduces chip clogging of the tap's flutes and reduces tap breakage during deep hole threading (more than 1 to 1-1/2 tap diameters in depth).

ZELX IQ taps are suitable for UNJ Aerospace internal threading applications

Taps have oxide surface treatment for uncoated tap.

YMW hand taps are designed to thread a wide variety of materials—steels, irons, brass and plastics—in through or blind hole conditions.

Hand taps store chips in their flutes adjacent to the chamfered teeth during the tapping operation.

Industrial Quality Hand Taps

Vanadium High Speed Steel Taps For Tapping Steels, Irons, Brass and Plastics

Taper (7 to 10 threads)

Has the longest standard chamfer ensuring easier starting and requires less tapping torque because of more working teeth.

Plug (3 to 5 threads)

The most common chamfer for use by hand or machine in through or blind holes.

Bottoming (1 to 2 threads)

For threading close to the bottom of blind holes, the least efficient standard chamfer.

Hand taps are manufactured from YMW's own high speed steel for maximum toughness and wear life.

Hand taps are the most popular style of general purpose taps for hand use, or for tapping under power.

YMW hand taps are designed to thread a wide variety of materials—steels, irons, brass and plastics—in through or blind hole conditions.

Hand taps store chips in their flutes adjacent to the chamfered teeth during the tapping operation.

Industrial Quality Hand Taps**Vanadium High Speed Steel Taps****For Tapping Steels, Irons, Brass and Plastics****YMW Optional Three Flute Taps**

Hand Taps with 3 flutes provide more storage space for chips when threading holes greater than 1-1/2 tap diameters in depth. Using hand taps with fewer than the standard 4 flutes reduces tap breakage caused by flutes clogging with product chips during deep blind hole tapping.

N-RZ**INDURTRIAL QUALITY N-RZ ROLL TAPS**

YMW-USA
#40-32-GH4
Custom Blended Vanadium High Speed Steel Taps**Bottoming Style**

(2 to 2-1/2 threads chamfered)

Improved performance, new tap design

DIN tap lengths, USCTI shank dimensions

Taps have an oxide coating for improved roll tapping in steels

Replaces #3510 and #3520 Roll Tap styles

For Stainless Steels, Alloy Steels and Ferrous Materials

DIN tap lengths, USCTI shank dimensions

N-RZ Roll taps can be run 1.5 times faster than the tapping speeds recommended for thread cutting taps.

Calculating Min and Max Drill Size for Roll Tapping**For Unified Inch Threads****Maximum Drill Size:**Basic Major Diameter - $\frac{3}{8N}$ **Minimum Drill Size:**Basic Major Diameter - $\frac{1}{2N}$

N = Number of Threads per Inch

For 60° Metric Threads**Maximum Drill Size:**

Basic Major Diameter - 0.375P

Minimum Drill Size:

Basic Major Diameter - 0.5P

P= Pitch

Note: Use millimeter value for basic major diameter and pitch: the drill size will be in millimeters

High Performance Thread Forming Taps for Dry Tapping

For Unified and Metric threads

**ZELX OL - RZ**

Cobalt, Vanadium Premium Steel Taps
 For Stainless Steels and Other Soft, Low and Carbon Steels
 DIN tap lengths, USCTI shank dimensions
Designed for shallow hole tapping < 1-1/2 diameters in depth.

OL-RZ Roll taps can be run 1.5 to 2 times faster than the tapping speeds recommended for thread cutting taps. Taps can be run dry or with mist coolant.

List 3580 Machine screw sizes
 Fractional sizes

Plug Style

(3 to 5 threads chamfered)

DIN tap lengths, USCTI shank dimensions

Taps have TiCN coating for coolant free roll tapping

Vanadium High Speed Steel Taps

YMW Roll Taps do not cut product threads, they form the threads, eliminating the problem of chip disposal in through or blind hole threading.

Roll tap tapping speeds can be increased by as much as double the speeds recommended for use with cutting style taps. Roll taps improve production rates due to the elimination of chips during threading, their stronger tool design and higher possible tapping speeds.

Roll taps require a larger drilled hole size prior to tapping.
See the tab le "Recommended Drill Size for Roll Taps."

Industrial Quality Roll Taps

For Unified and Metric threads

ROLL

Plug (3 to 5 threads chamfered)
Bottoming (1 to 2 threads chamfered)
USCTI dimensions
For tapping ductile materials
Taps have oxide surface treatment
7/16 to 1/2" taps have 4 lubrication grooves;
9/16 and larger have 6 grooves.

Industrial Quality Pipe Taps

TAPER PIPE TAPS—GENERAL PURPOSE

NPT Taper Pipe Taps. These general purpose taper pipe taps are ideal for threading a wide variety of materials, such as steels and irons, and can also be used for nonferrous and nonmetallic materials.

Ground thread taper pipe taps are standard in American Standard Pipe Form (NPT).

The nominal size of a pipe tap is that of the pipe fitting to be tapped, not the actual size of the tap. The thread tapers 3/4 of an inch per foot.

Troubleshooting

Problem	Causes	Solutions
Chipping	Excessive Tapping Speed Misalignment Hole Size is Too Small Poor Tapping Fluid	Increase Tapping Speed to 15-18 SFM Adjust or Use Radial Float Tapping Head Check Hole Size Use a Heavy Duty Lubricant
Poor Finish (Chatter Mark)	Excessive Tapping Speed Excessive Hook Angle Poor Tapping Fluid	Reduce Tapping Speed to 10-15 SFM Adjust Hook Angle During Regrind Use Cutting Oil or Tapping Lubricant
Stop Mark	Excessive Tapping Speed Poor Tapping Head Poor Setup	Reduce Tapping Speed to 10-15 SFM Use Floating Tapping Head Use special Design Taps or Threadmill

Interrupted Pipe Taps for NPT Threads

For American Taper

NPT ‡ Interrupted

TAPER PIPE TAPS—GENERAL PURPOSE

Interrupted NPTT taper Pipe Taps have full threads in the tap chamfer and for the first few threads. The balance of the threads are interrupted to reduce drag while threading. These pipe taps are standard having an odd number of flutes, 5 or 7.

Ground thread taper pipe taps are standard in American Standard Pipe Form (NPT).

The nominal size of a pipe tap is that of the pipe fitting to be tapped, not the actual size of the tap. The thread tapers 3/4 of an inch per foot.

Taps have oxide surface treatment

All pipe taps have a chamfer of 2-1/2 to 3 1/2 threads

Available in Bright. Add "B" to the end of the EDP no.

List 3435 Interrupted NPT

Nominal Size	Threads per Inch	No. of Flutes	EDP Numbers NPT or ANPT	Dimensions	
				Length of Thread	Length Overall

ZELX NI STI Taps

Cobalt, Vanadium Premium Steel Taps

For Nickel Base Alloys, Other Exotic Alloys, Mold and Stainless Steels > 30 Rc

ZELX NI Taps have been designed for extended for extended tap life in Cobalt, Nickel and Iron base exotic materials such as: Inconel, Hastelloy, Waspalloy and very hard Stainless Steels, Mold and Tool Steels.

STI taps are oversize to the extent that the internal thread which they produce will accomodate a helical coil wire screw thread insert, which at final assembly will accept a screw thread of the nominal size and pitch.

Special Fine Pitch Taps — Short Series, Ground Thread

C I 303

Unless otherwise specified, special taps 1.010" to 1.510" diameter inclusive having 14 or more threads per inch or 1.75 millimeter pitch and finer, and sizes over 1.510"

diameter with 10 or more threads per inch, or 2.5 millimeter pitch and finer, will be made to the general dimensions shown below:

Nominal Diameter Range Inches	Nominal Fractional Diameter Inches	Nominal Metric Diameter Millimeters	General Tap Dimensions - Inches				
			Overall Length L	Thread Length l	Square Length l ₂	Shank Diameter d ₁	Size of Square a

The above recommended taps normally produce the class of thread indicated in average materials when used with reasonable care. However, if the tap specified does not give a satisfactory gage fit in the work, a choice of some other limit tap will be necessary.

**Sizes through 1" diameter:
H1 = Basic PD to Basic PD + 0.0005"
H2 = Basic PD + 0.0005" to Basic PD + 0.0010"
H3 = Basic PD + 0.0010" to Basic PD + 0.0015"
H4 = Basic PD + 0.0015" to Basic PD + 0.0020"
H5 = Basic PD + 0.0020" to Basic PD + 0.0025"
H6 = Basic PD + 0.0025" to Basic PD + 0.0030"
Sizes larger than 1" diameter through 1-1/2"
H4 = Basic PD + 0.0010" to Basic PD + 0.0020"

Ground Thread Tap Limits

In addition to the nominal size and pitch of a tap, there is another important dimensional factor to be considered when selecting a ground thread tap for a given job. This factor is the pitch diameter tap limit, "H" and "L." "H" represents (high) above basic pitch diameter; "L" (low) is below basic pitch diameter. Tap limits have been established to provide a choice in the selection of the tap size best suited to produce the class of thread desired.

Figure 1 illustrates the numbering system and the .0005" diameter increment separation between successive limits. Because the starting point is basic pitch diameter, dividing the limit number by two establishes, in thousandths of an inch, the amount the maximum tap pitch diameter is above basic in the "H" series and the amount the minimum tap pitch diameter is under basic in the "L" series.

Figure 2 illustrates the positioning of the tap limits in relation to the various classes of threads for a 1/4-20 size.

Figure 1

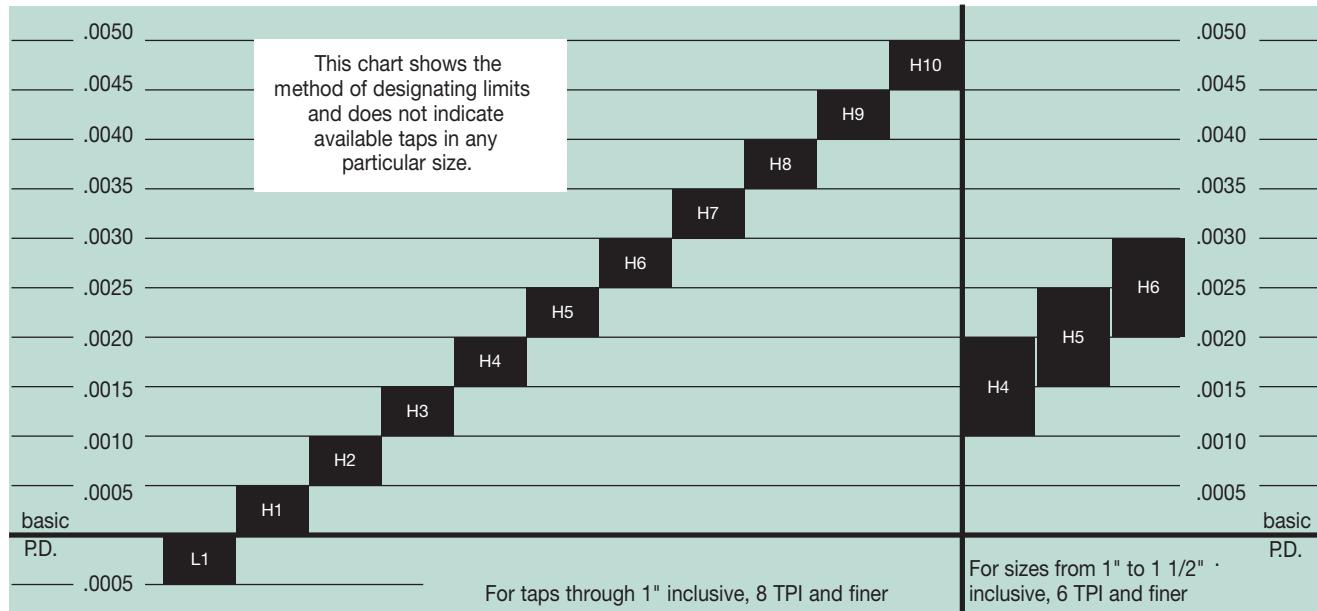

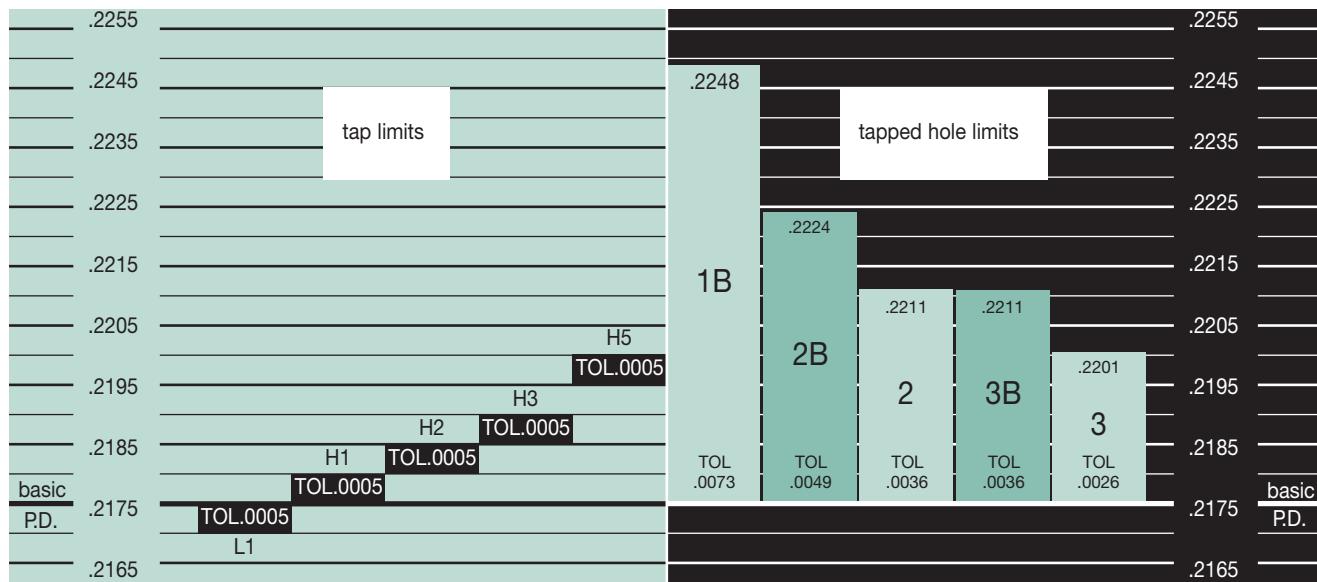

Figure 2

Class of Thread – 1/4 -20 UNC and NC

Tap Drill Size Selection

Recommended Percentage of Full Thread in Tapped Holes

To reduce tapping problems and improve tool life use the largest drill possible for the minor diameter. Select the percentage of thread height from the chart below to find the appropriate drill size for each size thread.

A minor diameter that provides a 55% to 65% thread is sufficient for good strength in most applications. In some cases it may be necessary to produce a thread with a higher percentage of thread height to meet minor diameter limits of the thread class specified or for added strength.

Material		>2D to L Tapping	Average Commercial Work	Thin Sheet Stock or Stamping
Free machining	Aluminum, Brass, Bronze, Cast Iron, Copper, Mild Steel, Tool Steel	60% - 70%	65% - 70%	75% - 85%
Harder materials or tougher machining	Cast Steel, Drop Forging, Monel Metal, Nickel Steel, Stainless Steel	55% - 65%	60% - 70%

TAP DRILL SIZE FORMULAR			PERCENTAGE OF FULL THREAD FORMULAR		
Drill Size = Tap Major Dia -	$0.01299 \times \% \text{ of Full Thread}$	# of Threads Per Inch	% of Full Thread =	Threads Per Inch	Major Dia - Drill
Example: To determine Drill Size for 3/4"—10 Tap, 70% Full Thread. Basic Major Diameter of Tap = .750"	$0.01299 \times 70 = 0.9093 \div 10 = .09093 \times .750 = .6591$		$0.01299 \times \% \text{ of Full Thread}$	$.750 - .6591 = .0844$	$\div 0.01299 = 6.497$

: cfa 'Tap Drill Sizes 7\ Uf

To reduce tapping problems and improve tool life use the largest drill possible for the minor diameter. Select the percentage of thread height from the chart below to find the appropriate drill size for each size thread.

A minor diameter that provides a 55% to 65% thread is sufficient for good strength in most applications. In some cases it may be necessary to produce a thread with a higher percentage of thread height to meet minor diameter limits of the thread class specified or for added strength.

Suggested Percentage of Full Thread in Tapped Holes

: CFA 'H5 D'8 F=@@G@N@ : CFAI @F		PERCENTAGE OF FULL THREAD: CFAI @F	
Drill Size = Tap Major Dia -	0.0068 x % of Full Thread X # of Threads Per Inch	Tap Major Dia - Drill Dia	0.0\$*,
Example: Determine Drill Size for '#-1\$ Tap, 70% Full Thread. Basic Major Diameter of Tap = .+\$ \$" 0.0068 x 70 = 0.4760 ÷ 1\$ = 0.0(+."1")\$ Drill Size = .+\$(&"		% of Full Thread = Threads Per Inch x	

Metric Tap Drill Sizes

Suggested Percentage of Full Thread in Tapped Holes

Material		2	C	c
Free Machining	Aluminum, Brass, Bronze, Cast Iron, Copper, Mild Steel, Tool Steel	60% - 70%	65% - 70%	75% - 85%
Harder Materials or Tough Machining	Cast Steel, Drop Forging, Monel Metal, Nickel Steel, Stainless Steel	55% - 65%	60% - 70%	

To reduce tapping problems and improve tool life use the largest drill possible for the minor diameter. Select the percentage of thread height from the chart below to find the appropriate drill size for each size thread.

A minor diameter that provides a 55% to 65% thread is sufficient for good strength in most applications. In some cases it may be necessary to produce a thread with a higher percentage of thread height to meet minor diameter limits of the thread class specified or for added strength.

Tap Size	Pitch		Minor Diameter (mm)		Metric Tap Drill Diameter									
	M	MF	Min. 6H	Max. 6H	80% Thread		75% Thread		70% Thread		65% Thread		60% Thread

Surface Treatment

Surface treatments are selected and applied to each tap depending on the material being tapped. An explanation of each type of surface treatment is shown in the following pages.

Nitriding

In Nitriding, Nitrogen and Carbon are allowed to soak into the surface of HSS tools, which reacts with the chemical composition of the HSS material to produce a hard nitride surface. There are 3 methods in the treatment, a composition gas method, a salt bath nitride method and a ion nitride method.

Salt bath nitride treatment has been changed into a gas nitride treatment method because of cyanic environmental pollution.

The Nitriding temperature of treatment is 500 to 550 degree. Hardness and depth of the treatment can be controlled by active nitrogen concentration and the reaction time.

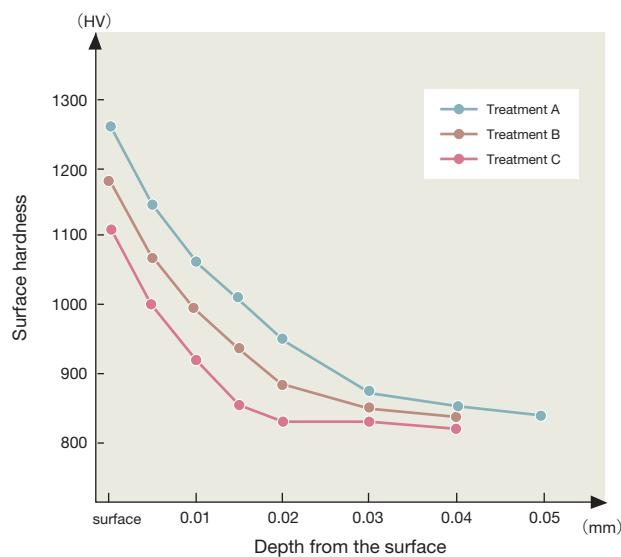

The high hardness of the tool surface minimize the chemical attraction to the tap material and results in less welding and it lowers the resulting friction resistance. A major improvement can be expected in tool's performance.

Yamawa have found the best combinations of hardness and toughness through its treatment technology.

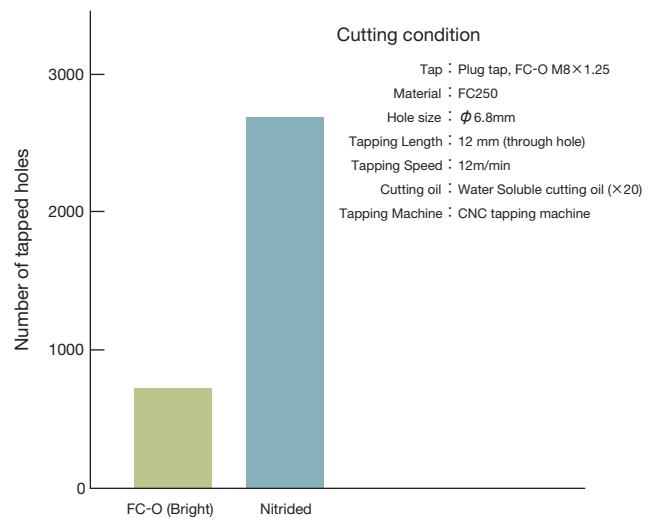

The nitriding treatment is widely applicable to workpiece materials like gray cast irons, special cast irons, aluminum diecastings with higher silicone content, copper alloys, and resinoids (plastics). These materials produce small segmental chips and are very abrasive.

Yamawa recommends nitrogen and oxidizing for comparatively sticky material such as high carbon steel and refined alloy steel. This double treatment improves the chipping resistance and has is a proven benefit in machining ferrous materials.

Depth and hardness of Nitride Surface Treatment

Efficiency of Nitride Treatment

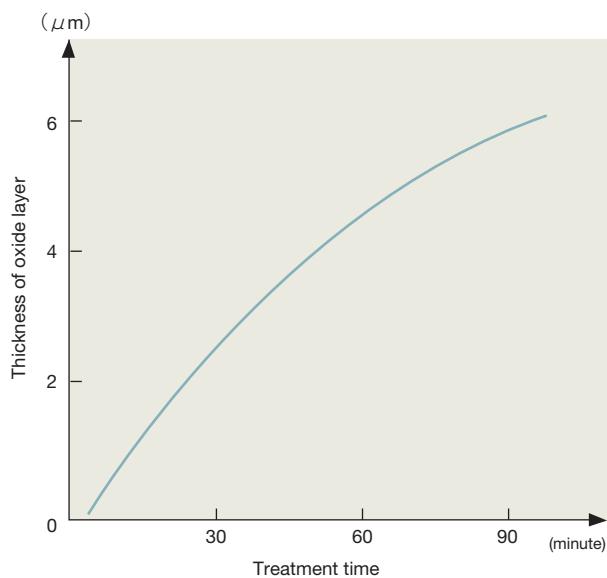

Each tap has the best surface treatment applied depending on the tapping purpose. Characteristics and effectiveness of surface treatment are introduced in next section.

Oxidizing

The first offering of this treatment was created using a HOMO furnace of LEED AND NORTHUP Company in the USA around 1938. It is called HOMO treatment. This treatment is also called vapor treatment and steam treatment. Through this treatment, a Fe3O₄ layer of blue black color is produced over the tool surface.

The oxidization treatment produces a porous layer on the tool's surface. This porous layer works as a series of oil pocket to hold the oil on the tap surface. The oxidizadaton helps to reduce friction, to avoid welding and to improve the surface roughness of internal screw. Moreover, longer tool life is experienced because the treatment reduces the remaining stress of HSS tools.

Thickness of oxide layer and the time of treatment

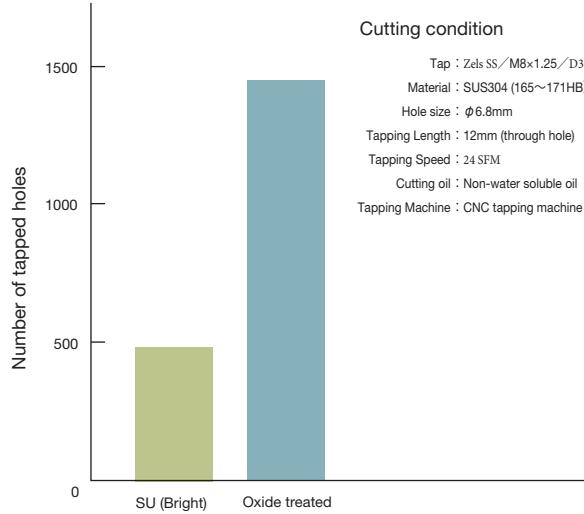

The oxidization treatment does not increase the hardness on tool surface. Using the furnace of YAMAWA original design and choosing the proper treatment surface Treatment time, we have been very good result of oxidizing for YAMAWA HSS tools.

Stainless steel and low carbon steel are materials that easily weld the chip to the tap. Yamawa applies this treatment to the special purpose taps as well for better tool life in these materials. Because of the reduction of frictional resistance, this treatment has a wide range of application in steel and stainless steel material fo better tool life.

Yamawa combines oxidizing with nitriding for taps designed for steels, alloyed steel, tool steels and stainless steels. This double treatment improves tool life in all types of ferrous materials.

Efficiency of oxide treatment

Surface Treatment

Each tap has the best surface treatment applied, depending on the tapping purpose. Characteristics and effectiveness of surface treatment are introduced in next section.

High speed cutting and hard-to-machine cutting are more popular in recent technology. To meet this tendency, a hard layer coating applied by vapor deposition over tool's surface has proven to increase tool life. There are two coating methods, CVD and PVD. The lower heat PVD process is mainly used for tap.

Physical Vapor Deposition

A vacuum chamber container of low heat and vapor deposition material are used to deposit the thin film coating by electric discharge on the surface of each tap.

Due to it's low reaction temperature (lower than 500° C), PVD makes little change of shape and hardness of HSS tools.

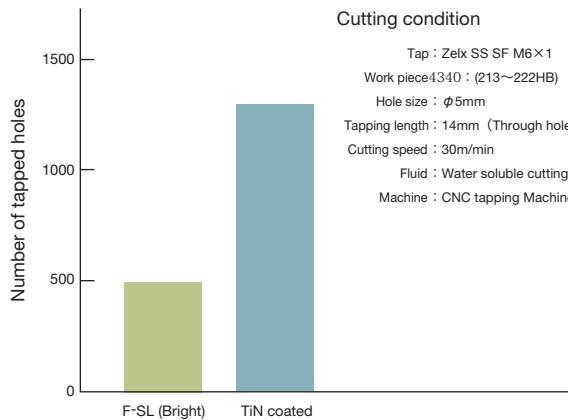

Yamawa has adopted an iron plating method, which coats a thin layer (1-4um) over our HSS and carbide tools. This layer processed by this method is very high in its adherence and its wear resistance.

The features and classification of coating

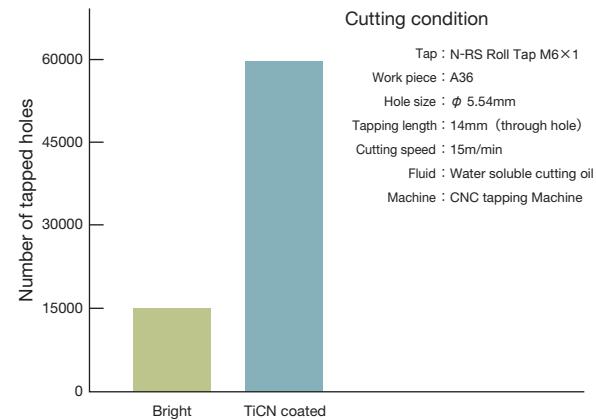

Classification	Titanium nitride (TiN)	Titanium carbonitride (TiCN)	Titanium nitride aluminum (TiAlN)	Hard chromium plating (CrN)
Features				
Vickers Hardness	2000~2400	3000~3500	2300~2700	1800~2200
Wear resistance	Good	Excellent	Excellent	Normal
Welding resistance	Good	Good	Good	Excellent
Heat resistance	Good	Normal	Excellent	Excellent
Acid resistance	Good	Normal	Excellent	Good
Slippery	Good	Excellent	Good	Excellent
Color	Gold	Blue Dray Violet	Violet	Silver
Workpiece materials	Carbon Steels Aluminum forging	Carbon Steels Hard Steels Stainless Steels Aluminum forging Cast Irons Brass • Bronze	Stainless Steels Cast Irons	Copper

Note: Evaluation (tri-level) of characteristic features is just comparative of these four coatings, TiN, TiCN, TiAlN, and CrN, in the table. These coatings have great advantages of wear resistance, welding resistance, and reduced friction resistance. The values of vickers hardness are also higher than the heat treatment or nitriding of HSS cutting tools from the table.

The efficiency of TiN coating

The efficiency of TiCN coating

How to determine which tap holder to use each machines type.

The function and aspect of machine feed system

Fully synchronous feed (Rigid) system

Spindle revolution and feed are synchronized, a perfect thread lead and feed per revolution are expected.

Master lead screw feed system

A better-feed condition is expected because the tap is fed by a master lead screw shaft that is the same pitch as this tap.

Gear feed system

The tap is fed at the same pitch by a combinations of gears. This creates better-feed condition.

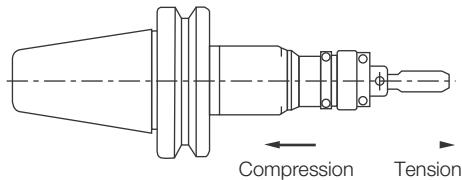

Asynchronous feed system by approximation

Use when the values of spindle rotation and the feed are set independently. Especially, if the machine feed value cannot be accurately predicted to be that of the tap lead.

Feed is controlled by a pressure regulation system which normally results in an inaccurate feed per revolution compared to the tap.

Feed is controlled by worker which is difficult to keep a stable amount of feed per revolution.

Holders aspects

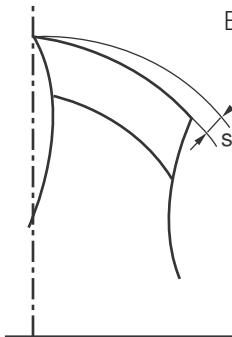

Spring direction

Completely fixed holder type

The tap is completely mounted with no axial or radial adjustment in the collet and holder.

Eccentric thread relief (no width of margin)

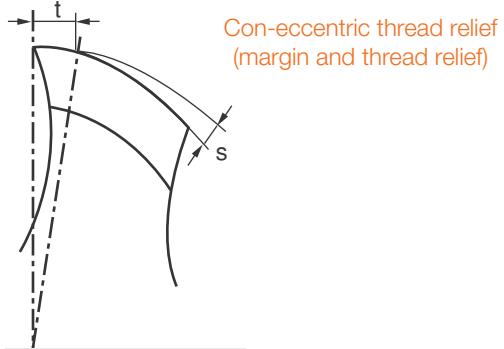

Cutting and machining performance are very high for this type of holder; however, a fully synchronous machining system with fixing holder is needed.

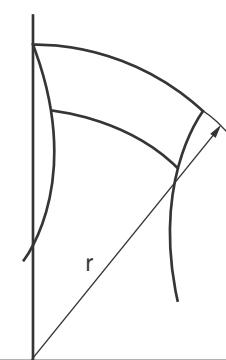

Example: "High speed tapping" and "fully synchronous tapping."

Adjustable spring floating holder (Tension & Compression)

Machine feed and tap's pitch errors are corrected by two types of spring system, Vertical tap's tensional direction and Vertical tap's compressional direction.)

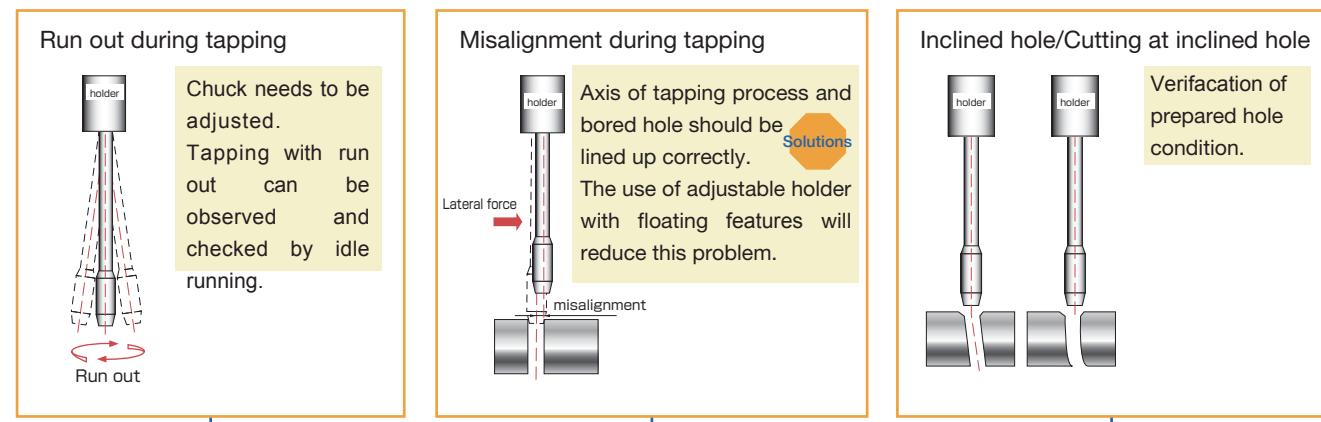

The combination of radial margin, thread relief and chamfer relief helps to make the correct tap guidance.

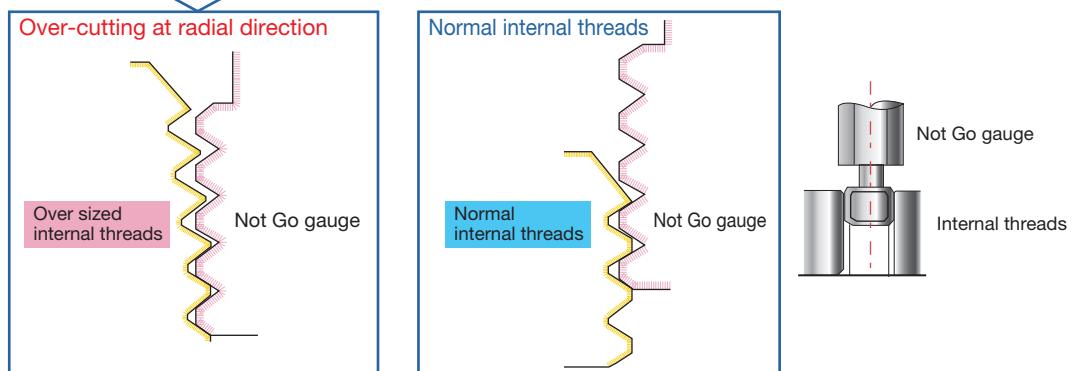

There is no radial relief at cutting edge creating an easy self-guidance of the tap while tapping under less synchronous feed condition.

Common reasons for over size-cutting of internal thread and its mechanism

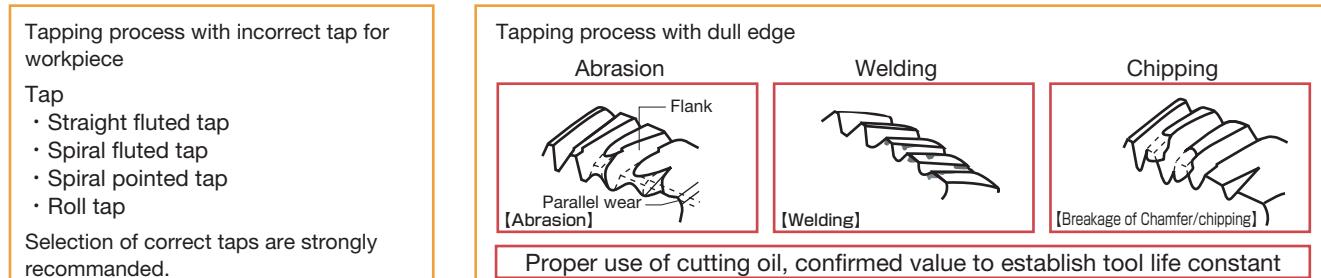

1. Run out, misalignment, inclined hole/cutting at inclined hole → Over-cutting at radial direction

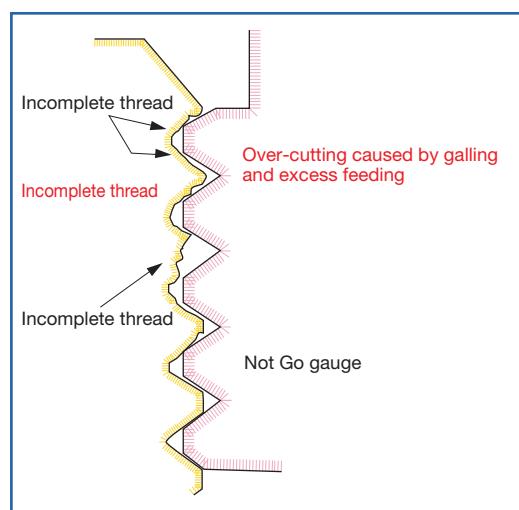

Over-cutting is caused by extra cutting of workpiece at rotational direction. This process is followed along bored hole, which small amount of over-cutting would be observed at bored hole bottom, and over-cutting would be observed at bored hole entrance.

2. Using a tap not suitable for the operation or a tap with a dull cutting edge may cause galling and over-cutting. Over-cutting caused by galling and excess cutting

A torn thread is observed at the surface of internal thread. When this situation is continued, over-cutting of internal thread, deformed threads, interrupted threads, and finally it leads to over-cutting of internal thread.

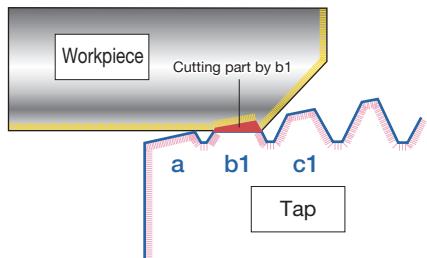

The reasons for over-cutting of internal thread lead and its mechanism

3. Tapping with improper feed condition → over-cutting at axial direction

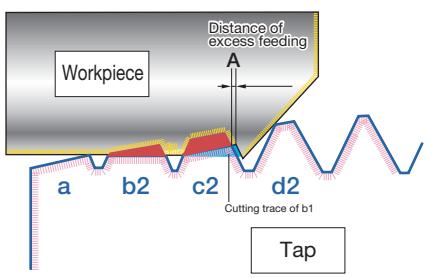

The mechanism producing an incorrect thread;

① At cutting edge b1, cutting chamfer

② Position after the tap rotates 1 turn.

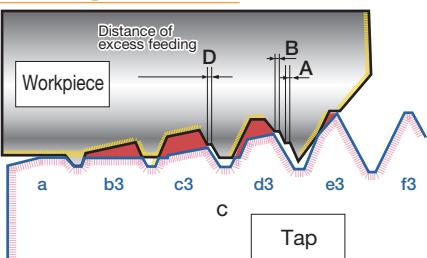

Cutting trace(b1) and thread phase of cutting face(c2) are misaligned creating the distance of excessive feeding A.

③ Position after the tap rotates 2 turns.

Cutting chamfer(c3) is misaligned until the distance of excess feeding B and cutting chamfer (d3) is misaligned until the distance of over feeding A+B.

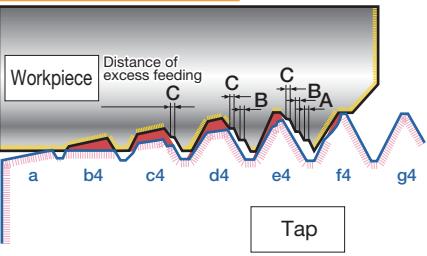

Cutting situation

④ Position of thread after 3 rotations of tap.

The thread continues to misalign until the distance of the thread lead is in error from excessive feeding C.

Cutting situation

Feed adjustment is strongly recommended.

* (Use of fully synchronous feed system and fixing holder)

Cutting machine that do not have the functions listed, such as drilling machine.

* The correct balance of main spindle adjustment is strongly recommended.

* Use an axial/radial floating holder for its adjustment.

over-cutting of the thread by excessive feeding.

A clearance gap is created at the back frank of thread. An additional amount of material is cut at front frank, creating an incomplete threads

over-cutting thread by too slow feeding;

This mechanism creates a the opposite of excess feeding or over-cutting internal thread. A clearance gap is created at teh front frank and extra material is cut at back frank.

Reasons for over-cutting during tapping process (overview)

- ① The tap mounting condition in the holder.
- ② The condition of bored hole.
- ③ The cutting oil selection.
- ④ Incorrect adjustment of feed balance.
- ⑤ Selecting the correct tap from the tap selection section.

Trouble Shooting

Troubles		Breakage			Excessive wear	
Check point		Prevent excessive cutting torque	Prevent clogging of chips	Tap	Workpiece	Tap
Segments						
Workpiece	Hardness	● Use workpiece which has even structure and hardness.			○ Use workpiece which has even structure and hardness.	
	Shape	● Pay attention for tapping position and material thickness.			● Pay attention for tapping position and material thickness.	
	Bored hole	○ Provide bigger bored holes. ● Prevent work hardening.			○ Provide bigger bored holes. ● Provide countersinking on hole entrance. ○ Prevent work hardening.	
		○ Provide deeper tapping hole. ● Prevent slanting of hole.				
	Machine	● Avoid inconsistent feed. ● Adjust feed stroke.				
	Jigs, Holders	● Use tap holder of floating type. ○ Use tap holder with torque limiter.				
Cutting condition		○ Reduce cutting speed.			○ Reduce cutting speed.	
Lubricant		● Use the other cutting oil which prevents cold welding. ● Use non soluble type cutting oil.			● Provide proper timing for changing or filling-up of cutting oil. ● Prevent mixing of other oil into cutting oil. ● Use other cutting oil which prevents cold welding. ● Use cutting oil of non soluble type. ● Adjust flow of cutting oil and method of lubrication.	
On process		● Remove unnecessary chips during tapping. ● Provide bigger space for chips disposal.				
Tap	Selection			● Use PO tap (through hole). ● Use SP tap (blind hole). ● Use Roll tap.		
	Design		● Provide bigger chiproom.	● Change material of taps. ● Provide proper hardness on taps.		● Use set tap. ● Change material of taps. ● Provide proper hardness on taps.
		● Reconsider length of cutting chamfer. ● Use set tap.			● Reconsider length of cutting chamfer. ● Provide nitride on taps.	
	Re-grind	● Be careful about burning during re-sharpening. ● Provide proper land.			● Be careful about burning during re-sharpening. ● Increase re-sharpening frequency.	

Undersize cutting of internal thread			Bad surface, surface damaged		
Improve cutting performance	Selection and design of tap	Work material	Improve cutting performance	Prevent welding	Check cutting condition
		●Check workmaterial.			●Provide proper hardness on workpiece material.
		●Pay attention for tapping position and material thickness.			●Pay attention for tapping position and material thickness.
●Adopt bigger tapping hole. ●Prevent work hardening of material.					
			●Prevent work hardening of material.	●Adopt bigger tapping hole.	○Prevent slanting of hole.
					○Feed according to pitch.
					●Use the tap holder of floating type. ●Prevent vibrating of axis of tap ●Prevent centering -off with work piece.
			●Reduce cutting speed.		
			●Provide proper timing for changing or filling-up of cutting oil. ●Prevent mixing of other oil into cutting oil. ●Use other cutting oil which prevents cold welding. ●Use cutting oil with non soluble type. ●Adjust flow of cutting oil and method of lubrication.		
				●Remove unnecessary chips around tapping.	
●Provide Nitride on taps.	○Use oversize taps.		●Use spiral pointed taps (for through hole).	○Provide oxide coating on taps.	○Use oil hole taps.
○Provide larger cutting angle.	●Adjust relief angle on cutting chamfer. ○Provide thread relief.		○Provide larger cutting angle. ●Adjust relief angle on cutting chamfer. ○Provide more narrow margin.	●Change of no. of flutes on taps.	●Reconsider length of cutting chamfer.
●Increase re-sharpening frequency.			●Increase re-sharpening frequency.	●Provide better surface finishing on flutes.	
			●Provide precise re-sharpening. ●Be careful about burning during re-sharpening.

※Letters in red mean Coarse screw threads.

※Please refer to PRAD system page 2 when you'd like to use PRAD system.

※Please contact our sales staff if you require the thread shown in above table, but its thread is not listed in this catalog.

Dimension table for Metric threads

Technical Information

Screw Thread Terms and Definitions

Major Diameter — The largest diameter of a straight thread.

Minor Diameter — The smallest diameter of a straight thread

Angle of Thread — The angle included between the flanks of the thread measured in an axial plane.

Half Angle of Thread — The angle included between a flank of thread and the normal (90°) to the axis, measured in an axial plane.

Pitch — The distance from a point on a screw to a corresponding point on the next thread measured parallel to the axis.

Metric — The pitch in inches = Pitch in Millimeters
25.4

Inches — The pitch in inches = $\frac{1}{\text{Number of threads per inch}}$

Lead of Thread — The distance a screw thread advances axially in one turn. On a single-thread screw the lead and pitch are identical. On a double-thread, the lead is $2 \times$ the pitch. On a triple-thread the lead is $3 \times$ pitch, etc.

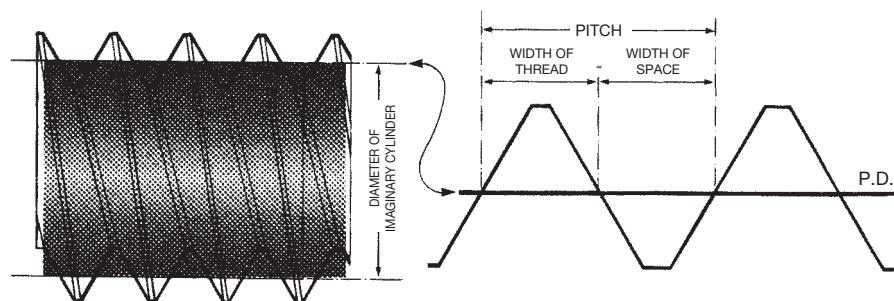

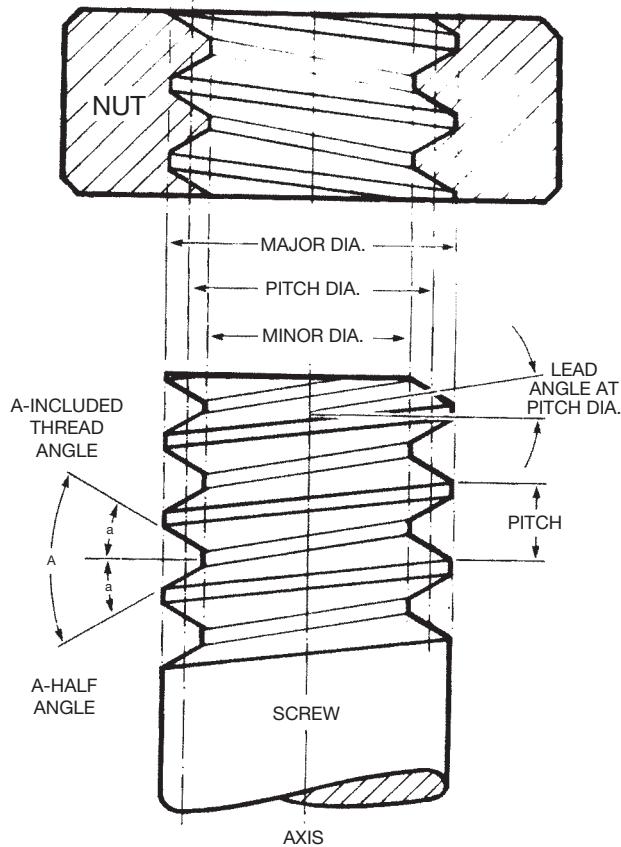

Lead Angle — The angle made by the helix of a thread at the pitch diameter with a line perpendicular to the axis.

Tolerance — The total amount of variation permitted from a specified dimension. Tolerance may be expressed plus, minus or both.

Allowance — The intentional minimum clearance between mating threads.

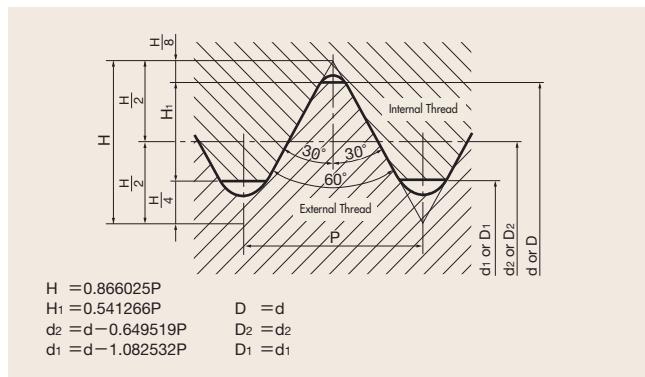

Length of Engagement — The length that is engaged measured parallel to the axis, when mating parts are fully assembled.

Pitch Diameter — On a straight screw thread, the diameter of an imaginary cylinder, the surface of which would pass through the threads at such points as to make equal the width of the threads and the width of the spaces cut by the surface of the cylinder.

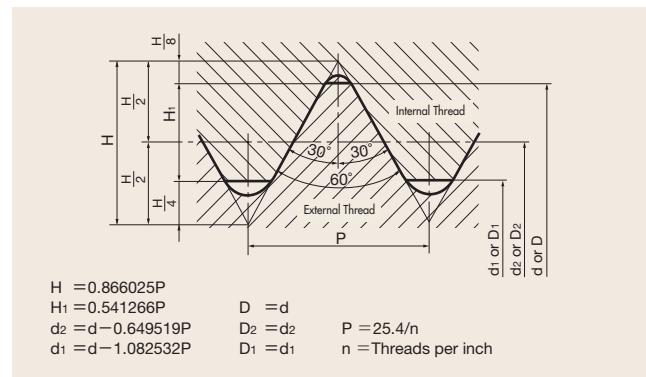

Basic profile of threads

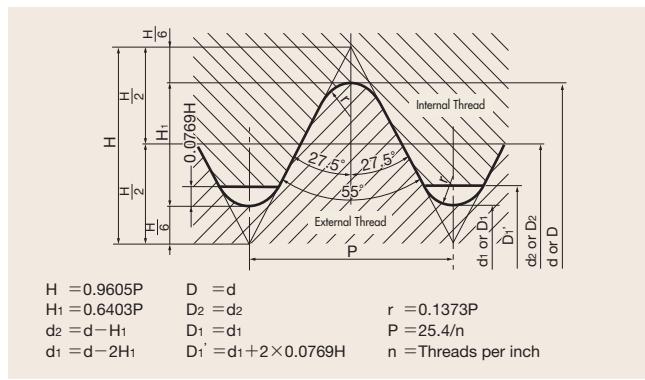

Metric Screw Threads (M)

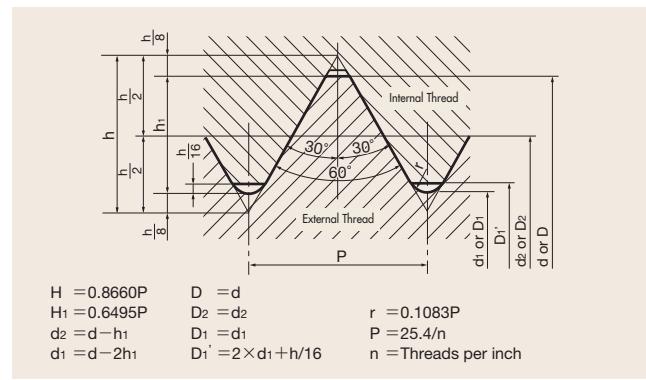

Unified Screw Threads (UNC, UNF, etc.)

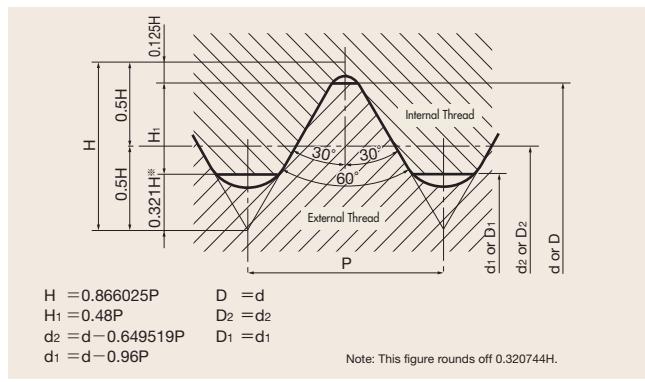

Whitworth Screw Threads (W)

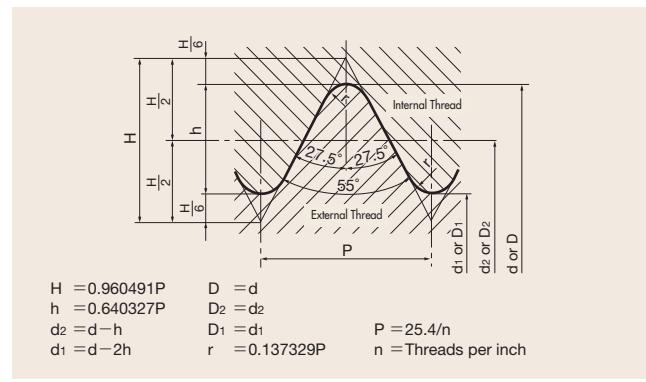

Screw Threads for Sewing Machine (SM)

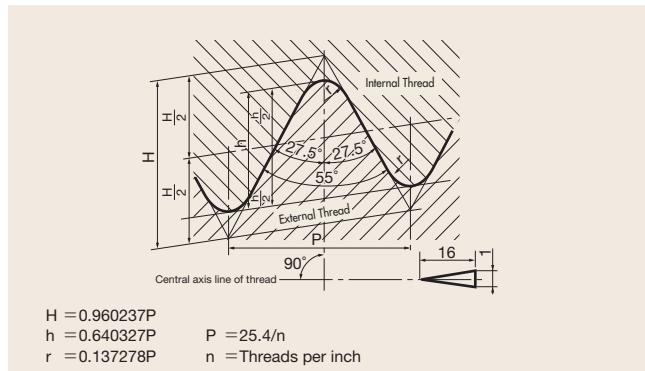

Miniature Screw Threads (S)

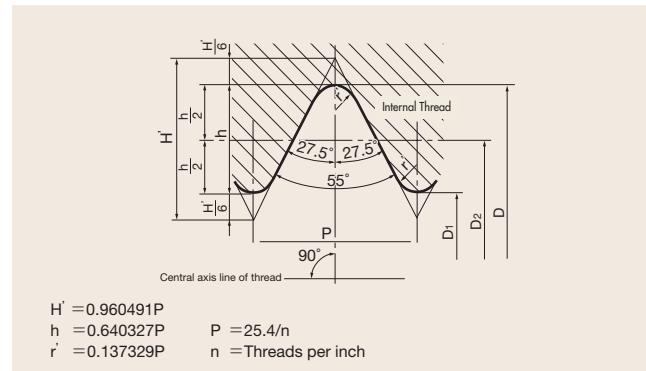

Parallel Pipe Threads (G, PF)

Taper Pipe Threads (R, Rc, PT)

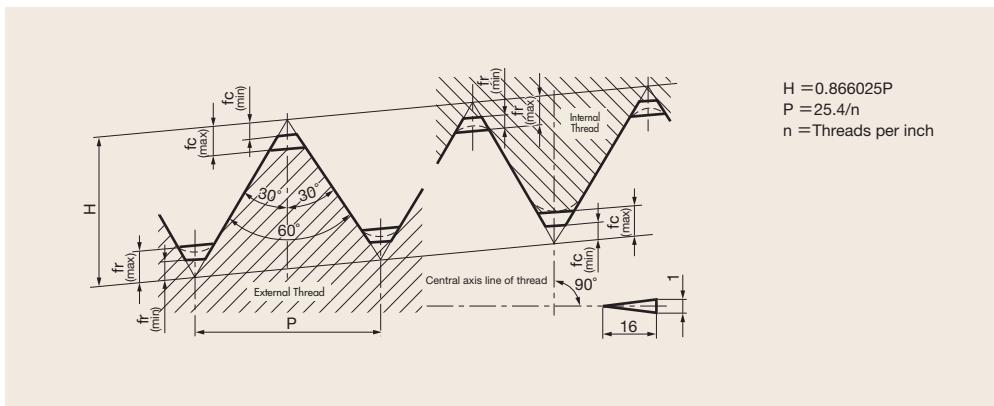

Taper Pipe Threads (Parallel) (Rp, PS)

Basic profile of threads

American Standard Taper Pipe Threads (NPT)

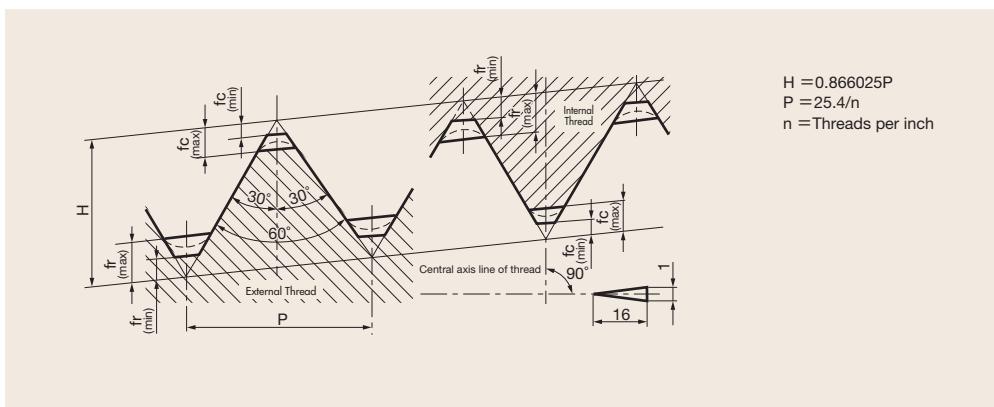

$$H = 0.866025P$$

$$P = 25.4/n$$

$$n = \text{Threads per inch}$$

Metric Trapezoidal Screw Threads (Tr)

$$H = 1.866P$$

$$H_1 = 0.5P$$

$$D = d$$

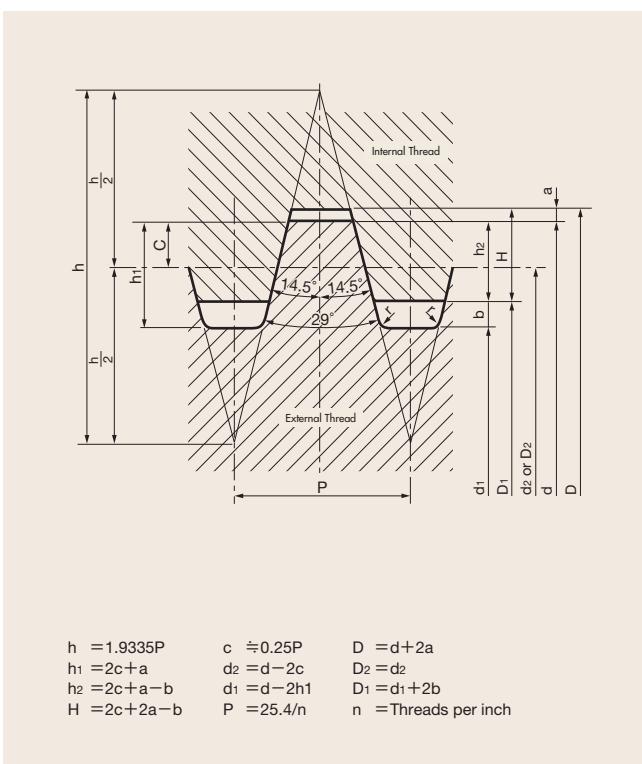

$$d_2 = d - 0.5P$$

$$D_2 = d_2$$

$$d_1 = d - P$$

$$D_1 = d_1$$

29° Trapezoidal Screw Threads (Tw)

$$h = 1.9335P$$

$$h_1 = 2c + a$$

$$h_2 = 2c + a - b$$

$$H = 2c + 2a - b$$

$$c = 0.25P$$

$$d_2 = d - 2c$$

$$d_1 = d - 2h_1$$

$$P = 25.4/n$$

$$D = d + 2a$$

$$D_2 = d_2$$

$$D_1 = d_1 + 2b$$

$$n = \text{Threads per inch}$$

USCTI SPECIFICATION

The following tables and formula are used in determining the limits and tolerances for ground thread taps having a thread lead angle not in excess of 5°, unless otherwise specified.

LEAD TOLERANCE

A maximum lead deviation of ±0.0005", within any two threads not farther apart than 1" is permitted.

ANGLE TOLERANCE

Threads Per Inch	Deviation in Half Angle
4 to 5-1/2 incl.	±20'
6 to 9 incl.	±25'
10 to 80 incl.	±30'

FORMULA

$$\begin{aligned} \text{Max. Major Dia.} &= \text{Basic} + A \\ \text{Min. Major Dia.} &= \text{Basic} + B \end{aligned}$$

In the above formula:

A = Constant to add = 0.130P for all Pitches

B = Major Diameter Tolerance = 0.087P for 48 Through 80 TPI
= 0.076P for 36 Through 47 TPI
= 0.065P for 4 Through 35 TPI

C = Amount over basic for minimum pitch diameter

D = Pitch diameter tolerance

$$\begin{aligned} \text{Max. Pitch Dia.} &= \text{Min.} + D \\ \text{Min. Pitch Dia.} &= \text{Basic} + C \end{aligned}$$

Note: When the tap major diameter must be determined from a specified tap pitch diameter, the maximum major diameter equals the minimum specified pitch diameter minus Constant C, plus 0.64952P, plus Constant A.

Threads Per Inch	A	B	C			D			
			To 5/8" Incl.	Over 5/8" to 2 1/2" Incl.	Over 2 1/2"	To 1" Incl.	Over 1" to 1 1/2" Incl.	Over 1 1/2" to 2 1/2" Incl.	Over 2 1/2"

*1 : Bold-faced numbers are based on the table of ASTM E 140

*2 : 1 Mpa=1N/mm²

*3 : In above table, numbers in parenthesis are only for reference.

This table is abstracted from SAE J 417.

YAMAWA STYLES OF TAPS

Straight Fluted Hand Taps

These are general purpose taps used for a wide variety of hand and machine tapping applications. They are available, in most cases, in taper, plug and bottoming chamfers and in various numbers of flutes.

Spiral Pointed Taps

These taps have a special angular grind at the point which shears chips and drives them ahead of the tap. Advantages are reduced tapping torque and increased speed in through hole tapping.

Spiral Fluted Taps

These taps are manufactured with spiral flutes for increased chip clearing efficiency in soft materials in which stringy chips are generated. Especially useful in tapping deep or blind holes, and in bridging keyways, these taps are available with regular or high helix flutes.

Forming Taps

Extra Length Taps

YMW-USA produces, as standard and special, two different types of taps with extra long shanks that permit tapping in deep or obstructed areas. They are extension taps are offered in spiral point and spiral flute.

Pipe Taps

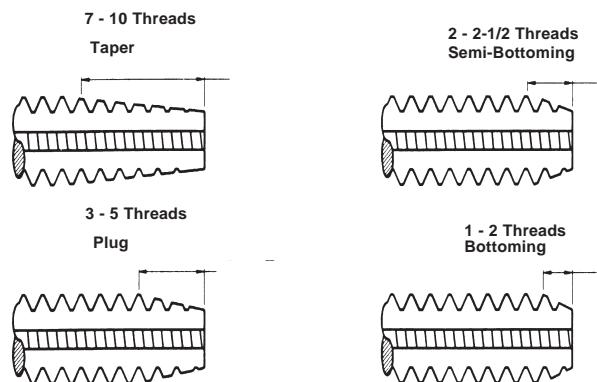

Taps for internal threading of pipe, pipe fittings, or holes in which threaded pipe is to be assembled are pipe taps. The types of pipe taps manufactured by YAMAWA for YMW-USA as standard include: Zelx SS Taper Pipe Taps, NPT Taper Pipe Taps in regular or interrupted thread; Zelx Mold NPT Taper Pipe Taps for hardened steels, Hand Tap design NPT Taper Pipe Taps, and Straight Pipe Taps. Interrupted thread pipe taps are manufactured with alternate teeth removed on adjacent lands (with the exception of the first few threads at the point). Designed for tapping certain tough metals or those which tend to tear or load the cutting teeth, these taps are to be used only when regular full thread taps fail.

Taper taps have 7 to 10 threads chamfered and are designed for threading through holes.

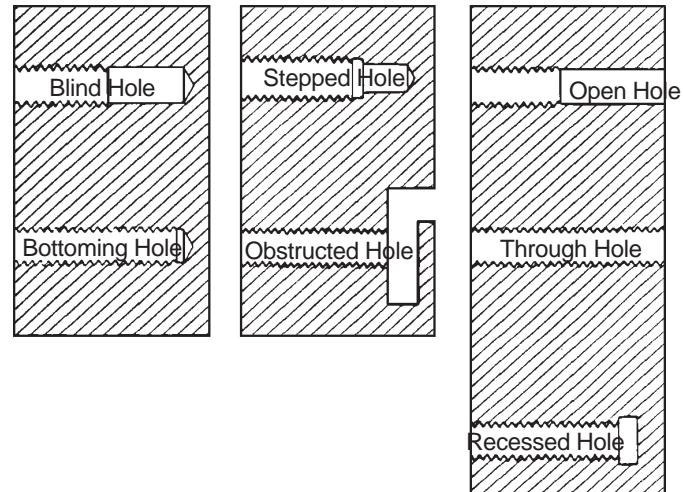

Plug taps have 3 to 5 threads chamfered and are most widely used in through holes and in blind holes that do not have to be threaded all the way to the bottom. Although most hand taps are available in taper, plug, and bottoming styles, some taps, such as pipe taps, are available only in the plug chamfer.

Semi-bottoming taps have 2 to 2-1/2 threads chamfered and are designed for both through and blind hole tapping.

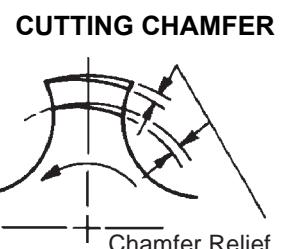

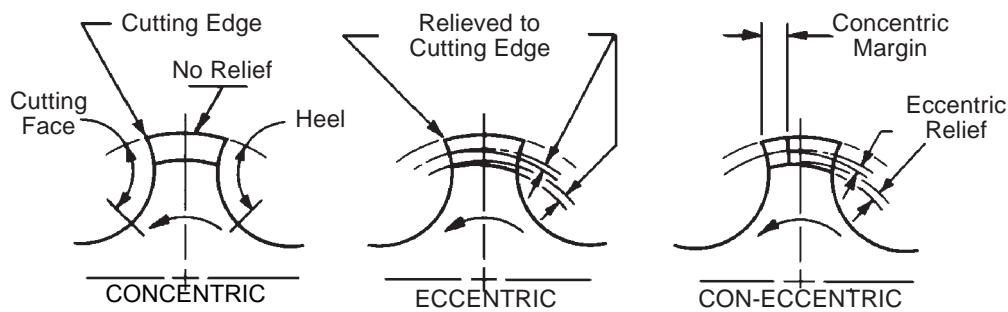

Bottoming taps have 1 to 2 threads chamfered, and are designed to thread blind holes close to the bottom.

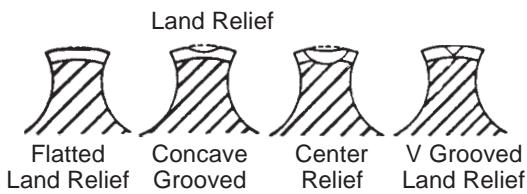

Types of Tapped Holes

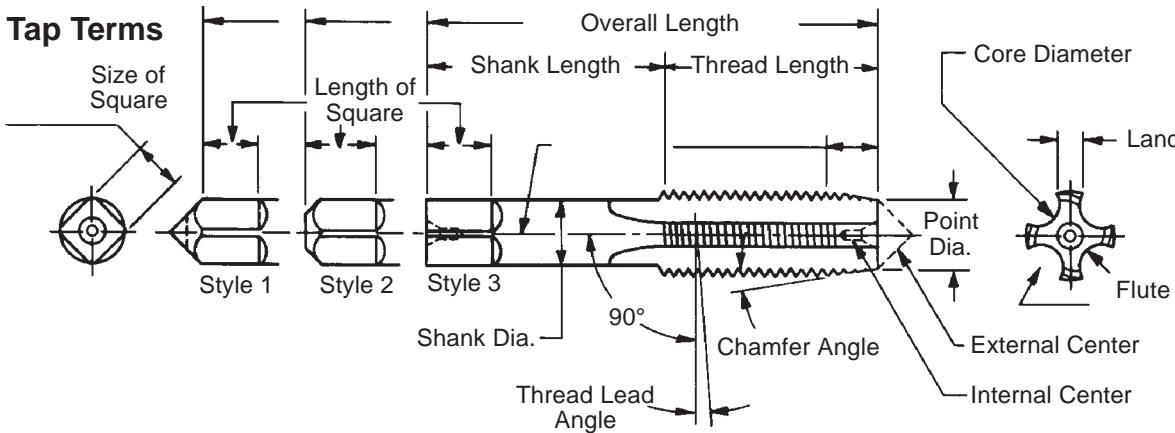

Clearance Relief Styles

ADDED RELIEF FOR DIFFICULT MATERIALS

ALLOWANCE. An allowance is an intentional difference in correlated dimensions of mating parts. It is the minimum clearance (positive allowance) or maximum interference (negative allowance) between such parts.

ANGLE OF THREAD. The angle included between the flanks of the thread, measured in an axial plane.

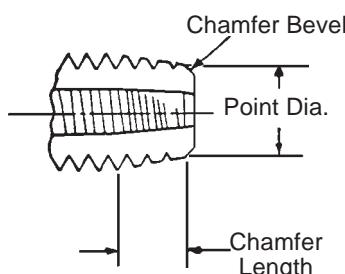

AXIS. The longitudinal central line through the screw or tap.

BACK TAPER. A slight axial relief on the thread of the tap which makes the pitch diameter of the thread near the shank somewhat smaller than that at the chamfered end. (See RELIEF)

BASIC. The theoretical or nominal standard size from which all variations are made. (See SIZE)

CHAMFER. The tapering of the end of the thread on a tap by cutting away and relieving the crest of the first few teeth to distribute the cutting action over several teeth. It also acts as a guide in starting the tap. When this tapering amounts to 8 to 10 threads, the tap is called a *taper* tap; when 3 to 5 threads, a *plug* tap; and with 1 to 2 threads chamfer, a *bottoming* tap.

Chamfer Dimensions

CORE DIAMETER. The diameter of an imaginary cylinder tangent to the deepest part of the flute.

CREST. The top surface joining the two flanks of a thread. The crest of an external thread is at its major diameter, while the crest of an internal thread is at its minor diameter.

CREST CLEARANCE. The space between the crest of a thread and the root of its component.

CUTTING EDGE. The leading side of the land in the direction of rotation for cutting and which does the actual cutting.

DEPTH OF THREAD. The distance between the crest and the base of the thread, measured normal to the axis.

DRYSEAL. A fuel connection for both external and internal application designed for use where the assembled product must withstand high fluid or gas pressures without the use of a sealing compound or where a sealer is functionally objectionable.

FLANK. The surface of the thread, sometimes referred to as side of thread, which connects the crest with the root.

FLUTES. The longitudinal channels formed in a tap to create cutting edges on the thread profile and to provide chip spaces and cutting-fluid passages.

FLUTE LEAD. The axial advance of a helical or spiral cutting edge in one turn around the tool axis.

HEEL. The face of the tap land trailing the cutting edge during forward rotation.

HEIGHT OF THREAD. The distance between the crest and the base of thread measured normal to the axis.

HELIX ANGLE—FLUTE. Flutes of taps are sometimes cut helically instead of straight. This helix angle is the angle made by the flute with the axis of the tap. (Helical flutes are sometimes called spiral flutes.)

HELIX ANGLE—THREAD. The angle made by the helix of a thread at the pitch diameter with a plane perpendicular to the axis.

HOOK. The concave cutting face of a tap land between the crest and the root of thread.

INTERRUPTED THREAD. A tap having an odd number of lands, with every other tooth along the thread helix removed.

LAND. One of the threaded sections between the flutes on a tap.

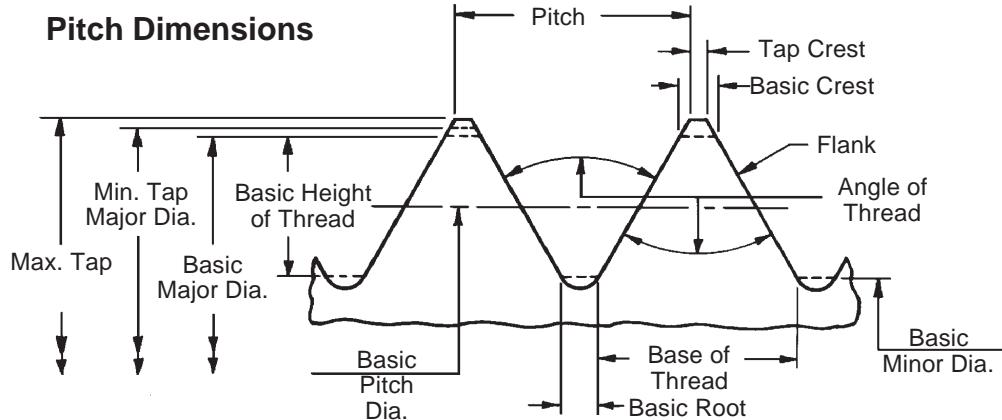

LEAD. The distance a screw thread advances axially in one complete turn. On a single-thread screw or tap, the lead and pitch are identical. On a double-thread, the lead is twice the pitch; on a triple-thread, the lead is three times the pitch, etc.

LEAD ERROR. The amount the actual lead of the screw thread differs from the specified lead.

LEAD—DRUNKEN. Irregular advance of the thread helix or lead. Usually called "drunken thread."

LENGTH OF ENGAGEMENT. The length of contact between two mating threaded parts measured axially.

LIMITS. The maximum and minimum sizes permissible for a specific dimension. (See ALLOWANCE AND TOLERANCE)

Pitch Dimensions

MAJOR DIAMETER. The largest diameter of a straight thread. On a taper thread, the largest diameter at any given plane normal to the axis. The term "major diameter" replaces the term "outside diameter" as applied to the thread of a screw or tap and also the term "full diameter" as applied to the thread of a nut or die.

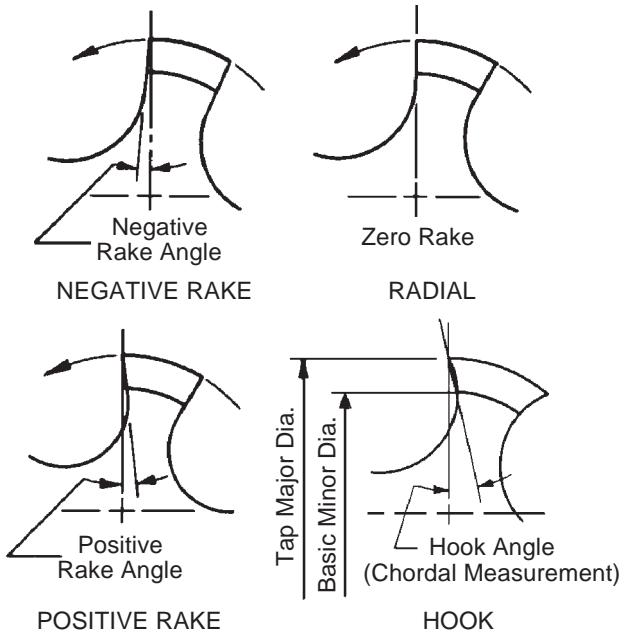

MINOR DIAMETER. The smallest diameter of a straight thread. On a taper thread, the smallest diameter at any given plane normal to the axis. The term "minor diameter" replaces the terms "root diameter" and "core diameter" as applied to the thread of a screw or tap and also the term "inside diameter" as applied to the thread of a nut or die.

PERCENT OF THREAD. One-half the difference between the basic major diameter and the actual minor diameter of an internal thread, divided by the basic thread height, expressed as percentage.

PITCH. The distance from a point on a screw thread to a corresponding point on the next thread, measured parallel to the axis and on the same side of the axis. The pitch equals one divided by the number of threads per inch.

PITCH DIAMETER. On a straight screw thread, the diameter of an imaginary cylinder, the surface of which would pass through the threads at such points as to make equal the width of the threads and the width of the spaces cut by a given distance from a reference plane perpendicular to the axis of an imaginary cone, the surface of which would pass through the threads at such points as to make equal the width of the threads and the width of the spaces cut by the surface of the cone.

PITCH LINE. A generator of the imaginary cylinder or cone specified in the definition of PITCH DIAMETER.

Rake Angles

RAKE. On a tap, any deviation of a straight cutting face of the tooth from a radial line. Positive rake means that the crest of the cutting face is angularly advanced ahead of the balance of the face of the tooth. Negative rake means that the same point is angularly behind the balance of the cutting face of the tooth. Zero rake means that the cutting face is directly on the center line.

RELIEF—RADIAL. The clearance produced by removal of metal from behind the cutting edge. Taps should have the chamfer relieved and should have back taper, but may or may not have relief in the angle and on the major diameter of the threads. When the thread angle is relieved from heel to cutting edge, the tap is said to have "eccentric" relief. If relieved from heel for only a portion of land width (usually 2/3) the tap is said to have "con-eccentric" relief. (See BACK TAPER)

Metalcutting Safety (read this before using YMW products)

Modern metalcutting operations involve high energy, high spindle or cutter speeds, and high temperatures and cutting forces. Hot, flying chips may be projected from the workpiece during metalcutting. Although advanced cutting tool materials are designed and manufactured to withstand the high cutting forces and temperatures that normally occur in these operations, they are susceptible to fragmenting in service, particularly if they are subjected to overstress, severe impact or otherwise abused. Therefore, precautions should be taken to adequately protect workers, observers and equipment against hot, flying chips, fragmented cutting tools, broken workpieces or other similar projectiles. Machines should be fully guarded and personal protective equipment should be used at all times.

When grinding advanced cutting tool materials, a suitable means for collection and disposal of dust, mist or sludge should be provided. Overexposure to dust or mist containing metallic particles can be hazardous to health particularly if exposure continues over an extended period of time and may cause eye, skin and mucous membrane irritation and temporary or permanent respiratory disease. Certain existing pulmonary and skin conditions may be aggravated by exposure to dust or mist. Adequate ventilation, respiratory protection and eye protection should be provided when grinding and workers should avoid breathing of and prolonged skin contact

with dust or mist. General Industry Safety and Health Regulations, Part 1910. U.S. Department of Labor, published in Title 29 of the Code of Federal Regulations should be consulted. Obtain from YMW and read the applicable Material Safety Data Sheet before grinding.

Cutting tools are only one part of the worker-machine-tool system. Many variables exist in machining operations, including the metal removal rate; the workpiece size, shape, strength and rigidity; the chucking and fixturing; the load carrying capability of centers; the cutter and spindle speed and torque limitations; the holder and boring bar overhang; the available power; and the condition of the tooling and the machine. A safe metalcutting operation must take all of these variables, and others, into consideration.

YMW has no control over the end use of its products or the environment into which those products are placed. YMW urges that its customers adhere to the recommended standards of use of their metalcutting machines and tools, and that they follow procedures that ensure safe metalcutting operations. The information included throughout this catalog under the heading "Technical Data" and other recommendations on machining practices referred to herein are only advisory in nature and do not constitute representations or warranties and are not necessarily appropriate for any particular work environment or application.
